

## Aerial Lift Certification Victoria

Aerial Lift Certification Victoria - Aerial Lift Certification is for individuals who requires an in-depth understanding of aerial lift safety. Inspectors and operators, construction craftsmen, supervisors and maintenance workers must perform a certificate and training program. State, federal and provincial regulations need companies to be certified in order to do in-house aerial lift inspections.

Regardless of differences in the type of work being carried out, all workers who perform tasks at elevated levels normally use the same means to access the needed height. Scissor lifts and aerial lifts are the mechanized machines used to lift equipment and workers to elevated sites.

Bucket trucks called Cherry Pickers are aerial platforms that feature a bucket and supported boom. The primary hazard to using this particular kind of platform is normally electrocutions, tip-overs and falls. Certification ensures that workers who make use of aerial lifts are correctly trained to safely operate the machine. Training also makes certain that workers know how to maintain aerial work platforms in accordance with the directions of the manufacturer.

Aerial lift training certification programs would include the following: Vehicle-mounted aerial lifts, Boom-supported aerial lifts and scissors lifts. Trainees would know about safe operating procedures and would gain knowledge about the hazards that usually lead to aerial lift accidents. They will be technically competent in the various types of aerial lifts, in addition to terms and components. From interpreting rated capacity charts to selecting the best aerial lift for the task, the certification program would provide workers with everything they must know to be able to safely carry out their work.

Inspectors and supervisors who have the job to inspect aerial lift machines need to know how to check booms, gears, operating mechanisms, structural parts, functions and control systems, braking systems, power plants, attachments, shafts and pins, hydraulic, pneumatic and electric parts, operator aids and emergency safety devices, et cetera. Training will include the following: the role of the inspector in lessening accidents and liability exposure; how to perform a pre-use, monthly and annual check; how to write inspection reports; how to apply and interpret regulations about aerial lift safety standards; checklists and techniques; inspection procedures; complying with record keeping requirements; applying and understanding the three levels of aerial lift inspection; and when to remove aerial lifts from service if they are defective.
